### Supreme Comfort Bedding Pellets Directions

We recommend 4 bags of our pellet bedding to start a 10 x 10 stall. This will provide adequate expanded bedding after the pellet “blooms” completely. This will provide extended absorbency and trapping of the wet spot, reducing ammonia levels and spreading of the wet spot in the stall. Every inch of expanded depth can absorb roughly 15 gallons of water. This assumes little or no evaporation.

You will ultimately use less bedding if you start the stall with this amount of bedding and maintain the same depth of expanded pellet fiber on a consistent basis (3-4 inches).

#### **Initial Stall Set-Up**

1. Stand all bags upright in the middle of stall, leaning slightly on one another for support. Cut the tops open allowing room to pour in water.
2. Pour in three (3) gallons of **HOT** water slowly, allowing bags to fill. Let stand for several minutes. Additional water may be added in the bag if you want a little more expansion.
3. Cut one side of bags from bottom to top and dump expanded bedding into the stall. Spread evenly throughout stall.

#### **Cleaning the Stall**

- a) Locate and remove the wet spot at each cleaning and sift any manure.
- b) Rake bedding, spreading any unused pellets over stall area.
- c) Add new bags to maintain desired expanded pellet depth, and repeat steps 1-3 under *initial stall set up* directions listed above.
